

Problems ♠–11

Due in DSC 235 by 12 noon, Friday, April 06, 2018

Problem A: All the points of a circle are arbitrarily painted in two colors. Does there necessarily exist an isosceles triangle, whose vertices are all the same color, inscribed in the circle?

Problem B: A pentagon is such that each triangle formed by three adjacent vertices has area 1. Find its area.

RULES:

- The competition is open to all *undergraduate* UNO students.
- The problems are selected and graded by the POW Committee consisting of Professors Andrzej Rosłanowski and Vyacheslav V. Rykov. However, please always submit your solutions to Andrzej Rosłanowski in DSC 235 or to his mailbox.
- Every nontrivial step/claim in your solution must be justified. There are no partial credits, so rather err on the side of caution and provide more explanations than less. (Needless to say, they should be written clearly and legibly.)
- The winners of Spring 2018 edition of POW will be determined at the end of the semester based on the number of correct solutions submitted.
- Problems will be posted by Friday 5pm and the solutions are due by the following Friday 12 noon.

PRIZES:

- Cash rewards for the winners of 1st, 2nd and 3rd place are \$400, \$200 and \$100, respectively. In the case of multiple persons receiving the same score the prizes will be suitably divided by the Committee.
- Everybody scoring in the POW Competition qualifies for the grand finale:
 $\frac{\pi}{2}$ *Mathematical Competition*.

The grand finale will take place on Saturday, April 21, 2018 with grand prizes of \$300, \$400, and \$600.
